The dataset 'prostate.csv' contains all clinical measures. Build a random forest model on datasets 'prostate.csv' assuming output variable as lpsa.

Description: Prostatectomy as a medical term refers to the surgical removal of all or part of the prostate gland. The level of prostate-specific antigen (psa) and a number of other clinical measures were examined in men who were about to receive a radical prostatectomy. The following are the variables which needs to be considered.

Input variable:

- a) log cancer volume (lcavol)
- b) log prostate weight (lweight)
- c) age
- d) log of the amount of benign prostatic hyperplasia (lbph)
- e) seminal vesicle invasion (svi) – binary variable
- f) log of capsular penetration (lcp)
- g) Gleason score (gleason) – ordered categorical variable
- h) percent of Gleason scores 4 or 5 (pgg45)

Output variable:

- a) log of prostate-specific antigen (lpsa)
